```
library(knitr)
# global chunk options
opts_chunk$set(cache = TRUE, autodep = TRUE)
```

We create a new global object `x` in the first chunk (a):

```
x = 5
```

Then we print it in the second chunk (b). Because we have set the global chunk option `autodep = TRUE` in the first chunk, **knitr** should be able to figure out that chunk b depends on chunk a.

```
(y = x + 2)

## [1] 7
```

You can verify it by changing chunk a to see if b also changes.
