This example shows you how to separate the source and output boxes by injecting the `kframe` environments between them.

```
library(knitr)
# modify the default chunk hook
hook_chunk = knit_hooks$get('chunk')
knit_hooks$set(chunk = function(x, options) {
  out = hook_chunk(x, options)
  gsub('(\\\\end\\{alltt\\})\\s*(\\\\begin\\{verbatim\\})',
       '\\1\\\\end{kframe}\\\\begin{kframe}\\2', out)
})
```

It is a hackish solution...
